

Avipro Travels – CMS Based Travel Package Website

Submission Deadline: 05 December 2025

1. Project Introduction and Objectives

The objective of Avipro Travels is the design and development of a dynamic, Content Management System (CMS)-based website for managing and displaying travel packages, adhering to the functionality and aesthetic concepts of the reference site (kashmirvendor.com).

The entire website is built using a pure **PHP/MySQL** stack, with the database driving all content, packages, and settings.

2. Core Requirements Met

The project successfully implements all specified front-end pages and backend functionalities:

2.1. Frontend Pages

- **Home Page (index.php):** Displays dynamic banner title and featured packages.
- **Tour Packages (packages.php):** Lists all available tours from the database.
- **Package Details (package_details.php):** Fetches and displays comprehensive package information (price, description, inclusions, exclusions) and the image gallery.
- **About Us (about.php) & Contact Us (contact.php):** Content is pulled dynamically from the site_settings table.
- **Booking / Enquiry Page (booking_enquiry.php):** Contains the required fields for submission.

2.2. CMS / Admin Panel

- **Admin Login System:** Secured using PHP Sessions and cryptographic password hashing (password_verify()).
- **Package CRUD:** Full capability to **Add**, **Edit**, and **Delete** packages and manage associated images (manage_packages.php, add_package.php, edit_package.php).
- **Enquiry View:** Allows administrators to view and update the status of incoming booking requests (view_enquiries.php).
- **Site Content:** Allows modification of 'static' content (banners, contact info, about us text) via the site_settings.php interface.

3. Technical Architecture and Data Structure

3.1. Architecture Overview

The system employs a classic 3-tier architecture with a strict separation between the secure administrative interface (admin/ folder) and the public application root.

3.2. Technical Stack

Component	Technology	Security/Method
Backend Logic	PHP (Core)	Secure PDO Prepared Statements
Database	MySQL	Data persistence and integrity
Authentication	PHP Sessions	password_hash() and password_verify()
Form Submission	JavaScript (Fetch API)	AJAX Form Submission (Asynchronous)
Form Validation	JavaScript & PHP	Required JS Validation (client-side) and server-side validation

3.3. Database Tables

The MySQL database (avipro_travels) uses five linked tables:

1. admin_users: Stores encrypted admin credentials.
2. packages: Core package data (title, price, description).
3. package_images: Stores paths to uploaded images (Foreign Key linked to packages with ON DELETE CASCADE).
4. enquiries: Stores all booking/contact submissions.
5. site_settings: Key-value storage for dynamic site content.

4. Implementation Highlights

- **Secure Form Handling:** The process_booking.php script is the target for the **AJAX** form submission, ensuring a seamless, non-page-reloading experience for the user.
- **Image Management:** The CMS handles both file system operations (saving and deleting physical images in the uploads/packages/ directory) and database record management.
- **Code Reusability:** The system extensively uses shared header/footer files (includes/header.php, includes/footer.php) to maintain consistency and efficiency.

5. Submission Checklist

The group confirms that the final submission package contains all required elements:

- **ZIP file** of the complete avipro-travels project directory.
- **Database file (.sql)** for importing the schema and data.
- **Admin login credentials** for testing the CMS.
- **Screenshots** of the required Frontend and Admin Panel pages.
